

Azienda Agricola La Morandina

In this estate strict organic practices have been utilized for over 30 years, in fact chemical pesticides have been banned in favour of sulphur and copper base products, manure and compost. Biological control is used against some kinds of pests. Leguminous plants are sown on the aisles between the rows of vines. Giulio and Paolo Morando closely collaborate with the University of Turin, where their uncle Albino has taught viticulture for many years, and a considerable amount of research work is carried out at the estate.
